SUMMARY

Technical co-founder and AI engineer who takes AI into operating businesses end to end: architecture, build, deployment, and the client relationship. Building a multi-model agent platform for home-services businesses; completed a paid engagement auditing a venture-backed startup's codebase and AI implementation ahead of its raise. Works across the full path: agent system design, legacy and modern API integration, production deployment, and advising leadership on AI adoption.

TECHNICAL SKILLS

Languages: JavaScript, TypeScript, Python, SQL

AI: Anthropic API / Claude, agentic architectures, prompt-injection defense, AI workflow automation, AI-assisted development (Cursor, Claude Code)

Backend & Infrastructure: Node.js, Supabase (PostgreSQL), Drizzle ORM, REST/SOAP APIs, Stripe, webhooks, Docker, Railway, Vitest

Mobile & Tooling: React Native, Git/CI-CD

EXPERIENCE

Ktwo.ai LLC

Remote

Technical Co-Founder

Dec 2025 – Present

- Technical co-founder of Ktwo, an AI operations product for home-services businesses (two co-founders; I own product and engineering)
- Rebuilt the platform from a Replit-generated portal, decomposing a 2,500-line route monolith and a 3,600-line dashboard and removing 15k dead lines
- Architected a three-stage agent pipeline: a Haiku classifier feeding a deterministic orchestrator, with Sonnet generating responses inside enforced business rules and prompt-injection isolation
- Migrated to Supabase Auth with mandatory 2FA (TOTP and SMS), AAL2 enforcement, and audited time-boxed impersonation
- Moved rate-limit state into Postgres for multi-replica safety and enforced structural tenant isolation via a tenant-scoped query wrapper with a static tripwire test
- Introduced the first test suite (Vitest) and deployed to Railway behind a gated waitlist
- Own product design, architecture, engineering, and direct business-owner conversations

Founder & Lead Engineer

Jul 2025 – Nov 2025

- Built and operated a client portal with analytics dashboards, Stripe billing with webhook signature verification, support ticketing with Slack alerts, and five-tier RBAC
- Signed and served the company's first paying client, a Danish wine retailer
- Integrated a legacy SOAP API to sync roughly 430 products with images in about 40 seconds using a field-level diff upsert with orphan deletion instead of full overwrite, eliminated N+1 queries via bulk field pre-declaration, and gap-filled images with 16-way bounded concurrency using jitter and backoff while constructing CDN URLs rather than downloading image bytes
- Built and scaffolded a React Native storefront and an OnPay-to-DanDomain order loop; the app never launched, blocked on DanDomain's SOAP order API before the engagement ended

The Zeya App

Miami, FL (Remote)

AI Consultant

Sep 2025 – Nov 2025

- Audited the codebase and AI implementation of a venture-backed consumer marketplace
- Presented security, architecture, and cost findings with recommendations to the founder and development team ahead of the company's \$2.45M raise
- Advised leadership on architecture, scalability, and AI integration strategy

EDUCATION

University of Miami Herbert Business School

Coral Gables, FL

BBA – Major in Artificial Intelligence for Business Technology

Expected December 2027

- Completed coursework in AI Cloud Computing, Foundations of AI, Intro to Machine Learning, and Programming (Fundamentals & Algorithms)

ADDITIONAL

Spoken Languages: Danish (native), English (fluent)

Other: Licensed Student Pilot (FAA Part 61), Phi Chi Theta Business Fraternity
